

Task says RIGHT ON LEFT. Reasoning reverses it to LEFT ON RIGHT.

FULL POLICY REASONING — INCORRECT STACKING ORDER

PLAN: 1. move to the left bowl, 2. grasp the left bowl, 3. move the left bowl to the right bowl, 4. release the left bowl from the right bowl, 5. grasp the right bowl, 6. move the right bowl to the tray, 7. release the right bowl into the tray

VISIBLE OBJECTS: akita black bowl 1 [114, 46, 141, 82], akita black bowl 2 [112, 116, 136, 150], new salad dressing 1 [72, 81, 111, 93], chocolate pudding 1 [160, 30, 189, 55], wooden tray 1 [104, 168, 190, 223]

SUBTASK REASONING: The robot needs to move to the left bowl to begin the stacking process, as it's the first step in transferring the bowls between locations.

SUBTASK: move to the left bowl

MOVE REASONING: The left bowl is positioned slightly higher than the right bowl, so moving down and forward will align the left bowl's base with the right bowl's top, allowing the robot to grasp it properly.

MOVE: move down and forward

GRIPPER POSITION: [104, 119]

TASK VS. REASONING

TASK: stack the RIGHT bowl on the LEFT bowl.

REASONING: move the LEFT bowl onto the RIGHT bowl—the stacking relation is reversed.

ACTION: the simulator reports the RIGHT bowl newly grasped, which is the task-correct source object.

Reasoning correctness: INCORRECT

Action task consistency: CORRECT (source-object selection)

Reasoning-action relation: DISAGREE

Kinematic score: 1.000

FAILURE MODE 1 — INCORRECT REASONING → TASK-CORRECT ACTION
